Syed Zaidi szaidi@us.ibm.com

November 2, 2016

Blockchain agenda

1. Double-entry bookkeeping and the business background to the Blockchain
2. The Hyperledger Project
3. Blockchain concepts and terminology
4. Hands-on Blockchain hands-on labs
5. Where do we go from here?

Section 1:

Double-entry bookkeeping and the business background to the Blockchain

Double-entry bookkeeping and the role of business ledgers

LEDGER

ACCOUNT TYPE		CASH			
TRANSACTION DATE	TRANSACTION DETAIL	REFERENCE	DEBIT	CREDIT	BALANCE
1/1/16	Expenses for Jan	Ref#1	\$100.00		\$100.00
2/1/16	Tax withheld	Ref#2		\$110.00	(\$10.00)

Luca Bartolomeo de Pacioli

Portrait of Luca Pacioli, traditionally attributed to *Jacopo de' Barbari*, 1495 (attribution controversial).^[1]

- Business transactions **typically involve various participants like buyers, sellers, and intermediaries** (such as banks, auditors, or notaries) whose business agreements and contracts are recorded in **business ledgers**.
- **A business typically uses multiple ledgers** to keep track of asset ownership and asset transfers between participants in its various lines of businesses.
- Ledgers are the systems of record (SORs) for a business's economic activities and interests.

Problems with current business ledgers

Current business ledgers in use today are deficient in many ways:

- They are **inefficient, costly, non-transparent, and subject to fraud** and misuse.
- **These problems stem from centralized, trust-based, third-party systems,**
- Having to **resolve disputes and possibly reverse transactions or provide Insurance for transactions is costly.**

.....

Lets look at some of the problems that Blockchain can solve

Blockchain and the Internet of Things in international trade

Overview

Our interactive demo tracks the shipment of a package as it moves along the supply chain, passing through multiple carriers. It shows how an IoT-enabled package transmits required status information along the way and how each transaction is tracked and shared among all partners in a blockchain.

Play

<https://www.ibm.com/internet-of-things/iot-news/announcements/private-blockchain/>

And then came Bitcoin and Blockchain

- Bitcoin is a cryptocurrency and a payment system
- invented by an unidentified programmer, or group of programmers, under the name of Satoshi Nakamoto.
- Bitcoin was introduced on 31 October 2008 to a cryptography mailing list, and released as open-source software in 2009.
- The system is peer-to-peer and transactions take place between users directly, without an intermediary.
- These transactions are verified by network nodes and recorded in a public distributed ledger called the blockchain, which uses bitcoin as its unit of account.

Section 2:

The Hyperledger project

The Hyperledger project

<https://www.hyperledger.org/>

The screenshot shows the Twitter profile of the Hyperledger Project (@Hyperledger). The profile header includes the Hyperledger logo (a geometric shape with nodes and lines) and the text "HYPERLEDGER PROJECT". Below the header, a bio states: "The Hyperledger Project is an open source, industry-wide project that brings together future and existing open source blockchain technology. Governed by The Linux Foundation, the project is building a general-purpose blockchain framework that can be used across industry sectors, from financial services to retail to manufacturing and more." A link to "hyperledger.org" is provided. The profile statistics show 1,511 tweets, 3,133 following, 7,262 followers, 273 likes, and 4 lists. A "Follow" button is visible. The "Tweets" tab is selected, showing a tweet from Hyperledger Project (@Hyperledger) with 55m retweets. The tweet text is "Australia reveals plans for Blockchain in public services". Below the text is a link to "govinsider.asia" and a small icon of a document.

The Hyperledger project

The Hyperledger project

- **A cross-industry collaborative effort, started in December 2015** by the Linux Foundation to support blockchain-based distributed ledgers
- It is focused on **ledgers designed to support global business transactions, including major technological, financial, and supply chain companies**, with the goal of improving many aspects of performance and reliability.
- The project aims to bring together a number of independent efforts to **develop open protocols and standards, by providing a modular framework that supports different components for different uses.** This would include a variety of blockchains with their own consensus and storage models, and services for identity, access control, and contracts.

The Hyperledger project

The Hyperledger Project defined a protocol specification known as **Open Blockchain Protocol Specification** to create a blockchain fabric for use in a variety of industry use-cases involving **B2B and B2C transactions**. The primary goals of this effort are:

- Support a wide variety of industrial use cases with different requirements
- Comply with regulatory regimes that exist today
- Support
 - verified identities, private and confidential transactions
 - permissioned, shared ledger
 - performance, scaling, auditability, identity, security, and privacy
 - reduction of costly computations involved in proof of work

Hyperledger's Blockchain fabric use the following concepts as its underpinnings:

- Smart contracts
- Digital assets
- System of record repositories/stores
- Decentralized consensus-based network
- Pluggable consensus algorithms/models
- Cryptographic security

Section 3: Blockchain Concepts and Technologies

Concepts and technologies: Blockchain

https://www.ibm.com/blockchain/what_is_blockchain.html

Before

- Asset ownership and transfer between businesses is currently inefficient, slow, costly and vulnerable to manipulation.
- Everyone has their own ledger where discrepancies between business parties can increase settlement times.
- A new way is needed for Internet-age market enablement.

Concepts and technologies: Blockchain

https://www.ibm.com/blockchain/what_is_blockchain.html

After

- Blockchain technologies can be used to share a ledger across
- the business network.
- The network will be private to the parties concerned, permissioned so only authorized parties are allowed to join
- Secure using cryptographic technology to ensure that participants only see what they are allowed to see.
- The shared ledger will be more robust, since it is replicated and distributed.
- All transactions against the ledger will require consensus across the network, where provenance of information is clear and transparent.
- Transactions will be immutable (unchangeable) and final.

Concepts and technologies: Shared ledger

https://www.ibm.com/blockchain/what_is_blockchain.html

Shared ledger

It can act as a source of truth for businesses doing transactions on a blockchain:

- Records all transactions across the business network
- Is shared among participants
- Is replicated so each participant has their own copy
- Is permissioned, so participants see only appropriate transactions

Often, companies have multiple ledgers for multiple business networks in which they participate. It can be used for recording and totaling financial transactions.

Concepts and technologies: Smart contracts

https://www.ibm.com/blockchain/what_is_blockchain.html

Smart contracts

A smart contract can include a digital asset which is anything that has an owner and can be converted into value. Digital assets can be tangible or intangible. A smart contract can also include a digital representation of a set of business rules:

- Is embedded in the blockchain
- Is executed in a transaction
- Is verifiable, signed, and encoded in a programming language
- For example, it defines conditions under which corporate bond transfer occurs

Concepts and technologies: Consensus

https://www.ibm.com/blockchain/what_is_blockchain.html

Consensus

Entries in the ledger are synchronized to all ledgers in the network. Consensus ensures that these shared ledgers are exact copies, and lowers the risk of fraudulent transactions since tampering would have to occur across many places at the exact same time.

- All parties agree to the transaction and validate it via the peer network.
- Rules can also be established to validate transactions.
- This trusted and trustless participation makes commitment possible at a low cost.

IBM Blockchain uses a “pluggable” consensus system to meet the needs of different industry segments.

Concepts and technologies: Privacy and Confidentiality

https://www.ibm.com/blockchain/what_is_blockchain.html

Privacy and confidentiality

- Ability to protect records with a personal digital signature —
 - the blockchain generates a private and public key to seal that record.
- It is encrypted, hashed, and sent to the network of validating nodes
- Unique IDs for customer, invoice and reference numbers
- Although the ledger is shared, sometimes participants require:
 - Private transactions
- Identities that cannot be linked to specific transactions
- Transactions need to be authenticated, and cryptography is central to these processes.

Concepts and technologies: Chaincode

<https://github.com/IBM-Blockchain/learn-chaincode>

- Chaincode is Go (GoLang) or Java code that enables users to interact with a blockchain network.
- Whenever you 'invoke' a transaction on the network, you are calling a function in chaincode that reads and writes values to the ledger.

Chaincode Hello World

<https://github.com/ALT-F1/chaincode-helloworld/blob/master/helloworld.go>

```
/*
The MIT License (MIT)
*/

....
// HelloWorld example simple Chaincode implementation
type HelloWorld struct {
}

// Init is called during Deploy transaction after the container has been
func (t *HelloWorld) Init(stub *shim.ChaincodeStub, function string, args []string) ([]byte, error) {
    ....
}
// Invoke is called for every Invoke transactions. The chaincode may change its state variables
func (t *HelloWorld) Invoke(stub *shim.ChaincodeStub, function string, args []string) ([]byte, error) {
    fmt.Printf("HelloWorld in Invoke with function %s!\n", function)
    if function != "invoke" {
        return nil, errors.New("Invalid invoke function name. Expecting \"invoke\"")
    }
    .....}
}
```

Chaincode Hello World

<https://github.com/ALT-F1/chaincode-helloworld/blob/master/helloworld.go>

```
// Query is called for Query transactions. The chaincode may only read
// (but not modify) its state variables and return the result
func (t *HelloWorld) Query(stub *shim.ChaincodeStub, function string, args []string) ([]byte, error) {
    myLogger.Debug("HelloWorld Query is called!\n")
    if function != "query" {
        return nil, errors.New("Invalid query function name. Expecting \"query\"")
    }
    .....
}

func main() {
    myLogger.Debug("HelloWorld Main\n")
    err := shim.Start(new(HelloWorld))
    if err != nil {
        fmt.Printf("Error starting HelloWorld chaincode: %s\n", err)
    }
}
```

Section 4: Hands-on Blockchain on Bluemix

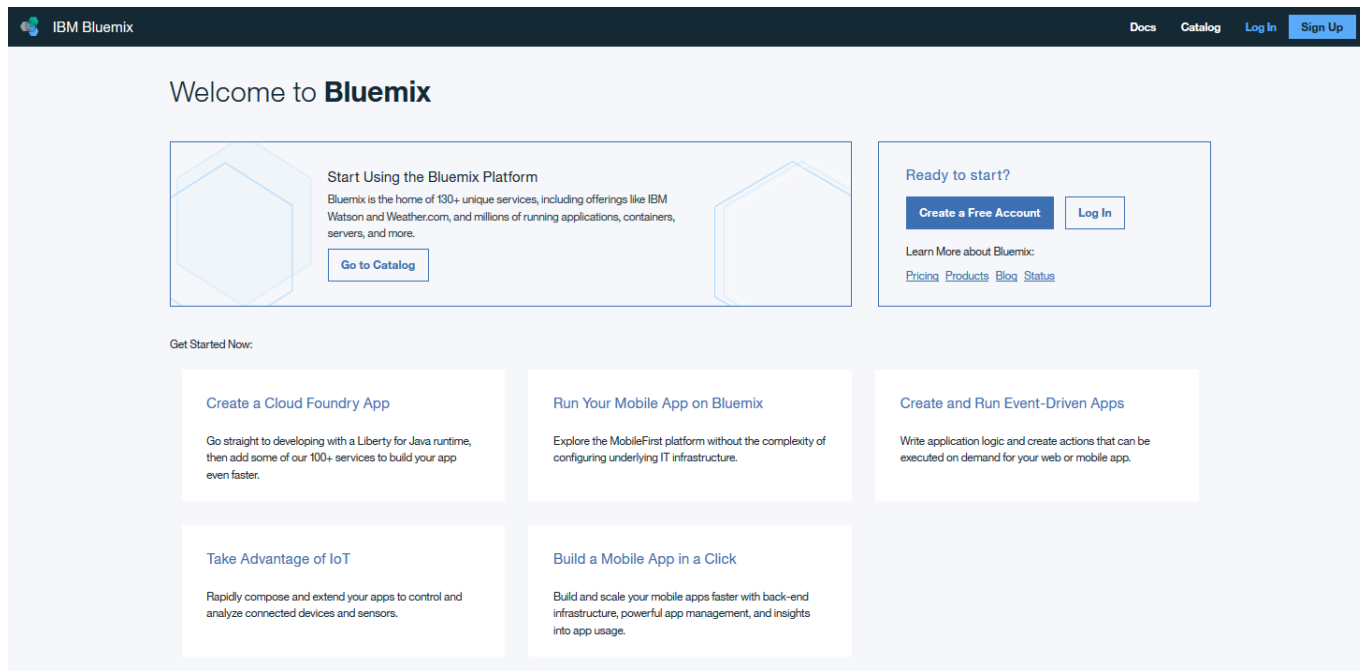

Sign up or log into bluemix.net and go to the Bluemix catalog

The screenshot shows the IBM Bluemix homepage. At the top is a dark navigation bar with the IBM Bluemix logo on the left and links for Docs, Catalog, Log In, and Sign Up on the right. The main content area has a light blue background. It starts with a 'Welcome to Bluemix' heading. Below this are two main boxes. The left box, titled 'Start Using the Bluemix Platform', describes the range of services available and includes a 'Go to Catalog' button. The right box, titled 'Ready to start?', features 'Create a Free Account' and 'Log In' buttons, along with links to learn more about Bluemix. Below these is a 'Get Started Now:' section containing six cards. Each card has a title, a brief description, and a link to a specific tutorial or guide.

Documentation

About blockchain

Last updated: 23 September 2016 | [Edit In GitHub](#)

What is blockchain?

Blockchain is a technology for a new generation of transactional applications that establishes trust, accountability and transparency, while streamlining business processes. The blockchain network was first introduced by bitcoin, but its practical uses extend far beyond cryptocurrency exchanges. With blockchain, IBM is reimagining the most fundamental business exchanges, and opening the door to a new world of digital interactions.

Blockchain is projected to vastly reduce the cost and complexity of cross-enterprise business processes. Its distributed ledger makes it easier to create cost-efficient business networks, where virtually anything of value can be tracked and traded, without a centralized point of control.

Blockchain is already showing great promise across a broad range of business applications. As just one example, blockchain networks allow securities trades to be settled in minutes, rather than days. Blockchain is also helping companies streamline the flow of goods and payments, and enabling manufacturers to reduce product recalls by openly sharing production logs with OEMs and regulators.

-  **Commercial Paper**
-  **Car Lease**

Using the Hello Chaincode tutorial

This tutorial guides you through using basic building blocks to code an elementary chaincode application. You will incrementally build a working chaincode that creates generic assets for exchanging on a network. Then you will interact with your chaincode through the network API. After completing this tutorial, you will be able to answer the following questions:

Marbles Demo

Application Background

Hold on to your hats everyone, this application is going to demonstrate transferring marbles between two users leveraging IBM Blockchain. We are going to do this in Node.js and a bit of GoLang. The backend of this application will be the GoLang code running in our blockchain network. The chaincode itself will create a marble by storing it to the chaincode state. The chaincode itself is able to store data as a string in a key/value pair setup. Thus we will stringify JSON objects to store more complex structures.

Attributes of a marble:

```
1. name (unique string, will be used as key)
1. color (string, css color names)
1. size (int, size in mm)
1. user (string)
```

We are going to create a Web UI that can set these values and pass them to the chaincode. Interacting with the chaincode is done with a HTTP REST call to a peer on the network. The ibc-js SDK will abstract the details of the REST calls away. This allow us to use dot notation to call our GoLang functions (such as `chaincode.init_marble(args)`).

Start the tutorials below to have your own marbles blockchain demo!

The screenshot shows the IBM Bluemix DevOps Services interface for a pipeline named "marbles-lennartf-1317". The top navigation bar includes links for DASHBOARD, MY PROJECTS, EXPLORE, HELP, BLOG, and COMMUNITY. Below the navigation bar, there are buttons for EDIT CODE, TRACK & PLAN, and BUILD & DEPLOY. The main content area features a welcome message and a video thumbnail titled "Build & Deploy Pipeline Core Concepts" with a duration of 2:58. The pipeline is currently in the "All Stages" view, showing two stages: "Empty Build Stage" and "Deploy to Bluemix". Both stages are marked as "STAGE PASSED". The "Empty Build Stage" shows a last input from a GitHub commit and a job named "Empty Build Job 1". The "Deploy to Bluemix" stage shows a last input from the previous stage and a job named "Push to Clo...". A "+ ADD STAGE" button is visible on the right.

EDIT CODE TRACK & PLAN BUILD & DEPLOY

Welcome to the Build & Deploy Pipeline

If you want to automate your continuous deployments, set up stages to retrieve input and run jobs, such as builds, tests, and deployments.

We've configured the first two stages and have deployed your sample app for you. Pushing changes to the repository automatically trigger a new build and then a deployment. To learn more about using [IBM Bluemix](#) with IBM Bluemix DevOps Services together for development and continuous integration, check out the [Build & Deploy Docs](#)

Car Lease Demo

Deploying the demo

To deploy to Bluemix simply use the button below then follow the instructions. This will generate the NodeJS server and the Blockchain service for you.

Deploy to Bluemix

To deploy the demo locally follow the instructions [here](#)

Application overview

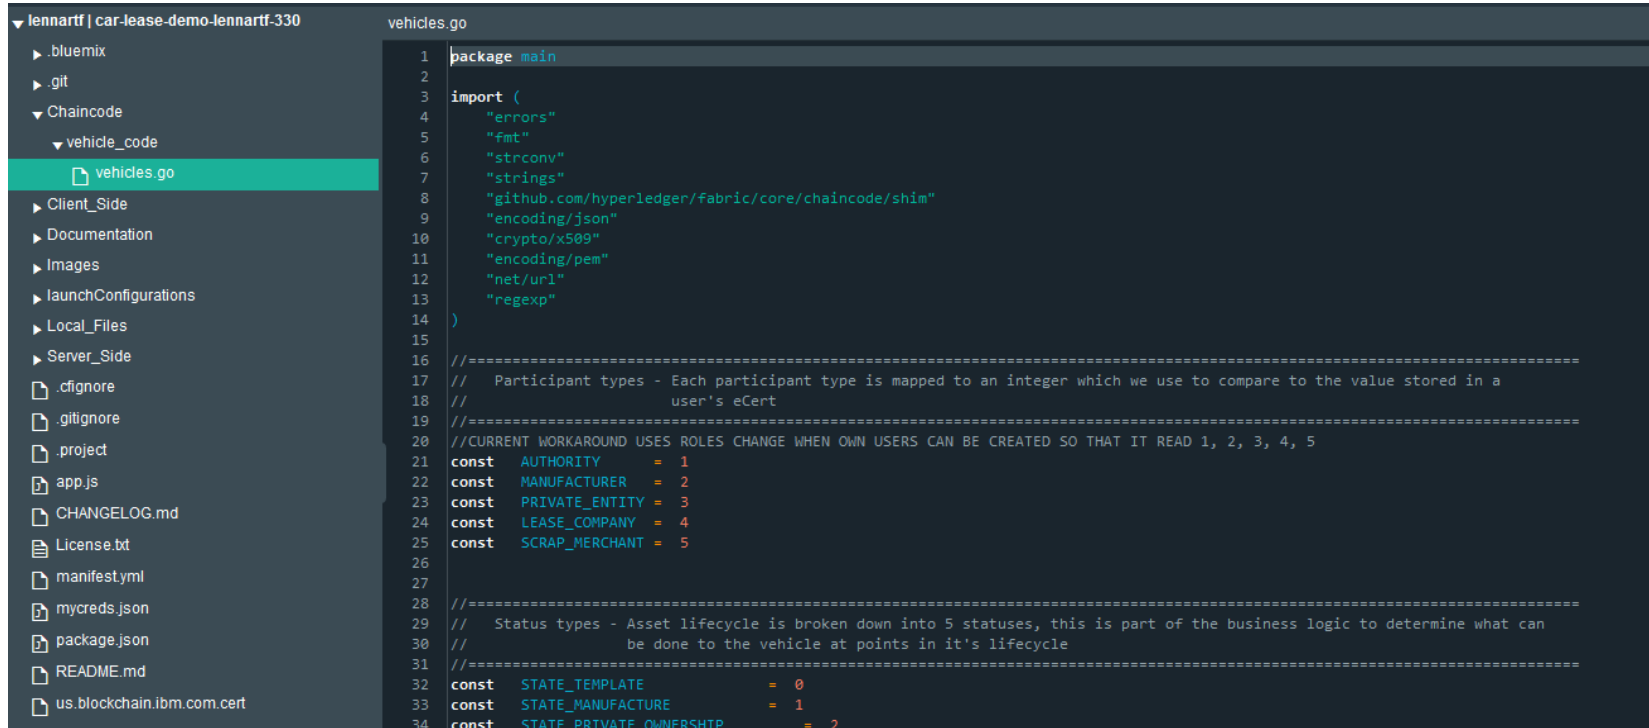

This application is designed to demonstrate how assets can be modeled on the Blockchain using a car leasing scenario. In the scenario vehicles are modeled using Blockchain technology with the following attributes:

Attribute	Type
V5clD	Unique string formed of two chars followed by a 7 digit int, used as the key to identify the vehicle
VIN	15 digit int
Make	String
Model	String
Colour	String
Reg	String
Owner	Identity of participant
Scrapped	Boolean
Status	Int between 0 and 4

LeaseContractID ChaincodeID, currently unused but will store the ID of the lease contract for the vehicle

The application is designed to allow participants to interact with the vehicle assets creating, updating and transferring them as their permissions allow. The participants included in the application are as follows:

Lab 3 Car Lease - Edit Code – Build and Deploy – Chain Code

The screenshot shows a code editor interface. On the left is a file explorer for a project named 'lennartf | car-lease-demo-lennartf-330'. The 'Chaincode' folder is expanded, showing 'vehicle_code' and 'vehicles.go' (which is selected). Other files in the explorer include 'Client_Side', 'Documentation', 'Images', 'launchConfigurations', 'Local_Files', 'Server_Side', '.cignore', '.gitignore', '.project', 'app.js', 'CHANGELOG.md', 'License.txt', 'manifest.yml', 'mycreds.json', 'package.json', 'README.md', and 'us.blockchain.ibm.com.cert'.

The right pane shows the code for 'vehicles.go'. The code is as follows:

```
1 package main
2
3 import (
4     "errors"
5     "fmt"
6     "strconv"
7     "strings"
8     "github.com/hyperledger/fabric/core/chaincode/shim"

Bluemix Catalog, create and a Blockchain service

Service name:

Blockchain-kl

Credential name:

Credentials-1

Features

- **Spin up a test Blockchain Network in one click**

Spend less time creating and managing a blockchain network and more time focusing on writing your applications.

- **Create confidential digital assets**

Create digital transactions in your test applications that are processed quickly and securely over your permissioned network.

- **Membership services**

Take advantage of our first implementation of the membership services module, which encompasses many of the latest advances in cryptography.

- **Work with chaincode**

Smart contracts, written in chaincode, contain embedded business logic that allows you to define assets and write transaction instructions.

Welcome to the Starter Developer Network
on IBM Blockchain!

LAUNCH

Welcome, alif@us.ibm.com!

This service is intended for developers who consider themselves early adopters and want to get involved with IBM's approach to business networks that maintain, secure and share a replicated ledger using blockchain technology.

Bluemix Catalog, Blockchain service menu, select Demo Chaincode

IBM Blockchain

Network ID: 3c945fd9b0e645648ef133fd9f8f88d9

Network Blockchain Demo Chaincode APIs Logs Status Support

Getting Started

Welcome to your blockchain network's console page. From here you can do many things.
If this is your first time using IBM Blockchain you should deploy some chaincode. Our Demo Chaincode tab can help with that!

Network View the status of your network peers and deployed chain code	Blockchain Explore transactions written to the network	Demo Chaincode Deploy sample chain code templates in one-click	APIs Learn and interact with API docs
---	--	--	---

Logs
View peer or membership service logs

Deploy your first chaincode!

- 1) Go to "Demo Chaincode" and select a chaincode template. Then hit deploy.
- 2) Click the pre-built query/invoke buttons.
- 3) Take the sample to the next level by creating API calls in the "APIs" tab. You can get the chaincode ID from the networks tab.

Welcome to the IBM Blockchain API

IBM Blockchain API

Interact with the enterprise blockchain through IBM Blockchain API

Block

Show/Hide | List Operations | Expand Operations

GET /chain/blocks/{Block}

Individual block information

Implementation Notes

The {Block} endpoint returns information about a specific block within the Blockchain. Note that the genesis block is block zero.

Response Class (Status 200)

[Model Details](#) | [Model Schema](#)

```
{

Where do we go from here

IBM Bluemix Garage for blockchain

<https://www.ibm.com/blockchain/garage.html>

Using the Hello Chaincode tutorial

This tutorial guides you through using basic building blocks to code an elementary chaincode application. You will incrementally build a working chaincode that creates generic assets for exchanging on a network.

Then you will interact with your chaincode through the network API.

After completing this tutorial, you will be able to answer the following questions:

- What is chaincode?
- How do I implement chaincode?
- What dependencies exist?
- What are the major functions?
- How do I pass different values to my arguments?
- How do I securely enroll a user on my network?
- How do I compile my chaincode?
- How do I interact with my chaincode through the REST API?

https://console.ng.bluemix.net/docs/services/blockchain/ibmblockchain_tutorials.html#hellocc

Learn Chaincode

A tutorial to get you started with writing smart contracts for Hyperledger.

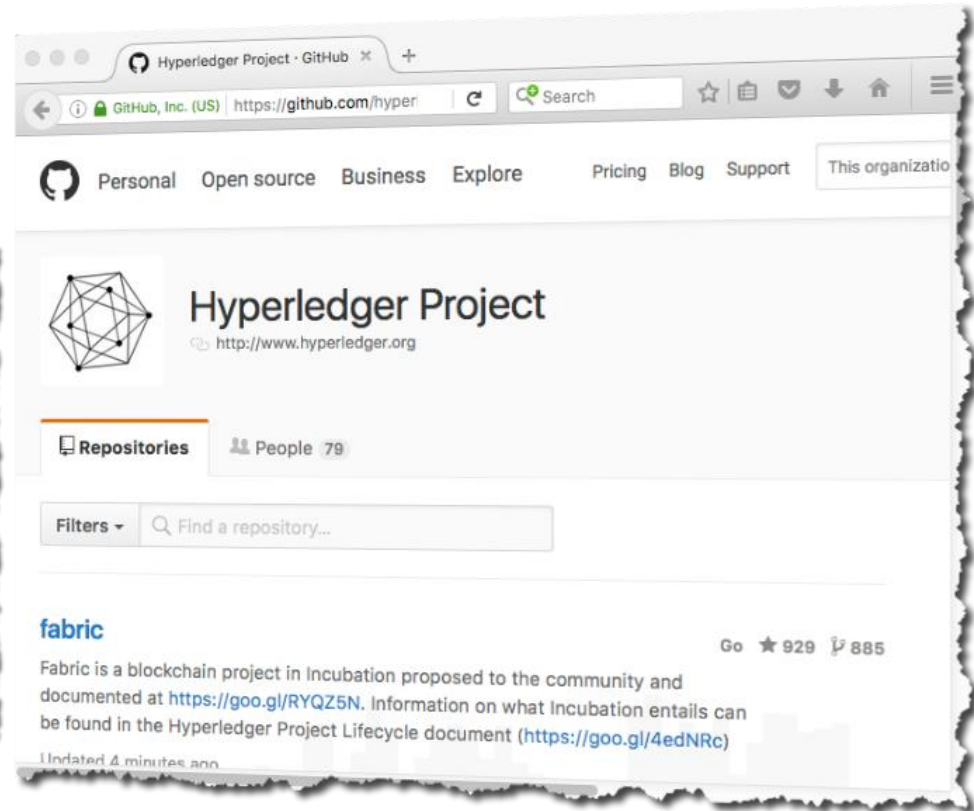

Deployment

In order to support multiple versions of the Hyperledger fabric, this repository uses branches in combination with gopkg.in URLs. What does this mean for beginners? Just pick the branch below and use the instructions for that branch to complete the tutorial

<https://github.com/IBM-Blockchain/learn-chaincode/blob/master/README.md>

Educate Yourself!

- Everything is available through the web:
 - <http://hyperledger.org>
 - <https://github.com/hyperledger>
 - <http://ibm.com/blockchain>

Thank You!
